1. Introduction

Prompting in English yields improved performance across many cross-lingual tasks. For example, Jiang et al. (2019) report increased accuracy in knowledge extraction when using English prompts versus diversified manual prompts. Lin et al. (2021) observe that, for natural language understanding and machine translation across 30 languages, English prompts outperform multilingual configurations and even surpass baselines such as GPT-3. Similarly, Muennighoff et al. (2023), Nie et al. (2024), Tu et al. (2022), and Zhang et al. (2023) report notable gains measured by accuracy, F1 scores, and BLEU when models are prompted in English.
